

Dentist Veneers Chilliwack

Veneers are really thin slices of tough, tooth shaped ceramic porcelain which are customized by a dental lab to match the shape and colour of your current teeth. They may be cemented onto the fronts of your teeth to help make a beautiful and alluring smile. Veneers may be used to entirely refashion your smile and teeth. Also, they can often be employed as alternatives to tooth crowns and may make a perfect solution in managing some dental health ailments.

Veneers are not permanent solutions and may need replacement after some time due to every day deterioration. Still, these restorations are very durable and may last for several years.

Porcelain veneers can be utilized aesthetically, to produce a white, beautiful, harmonized smile, to fill unnecessary spaces, to help worn or chipped teeth, to treat stained or discoloured teeth, to treat crooked or misshapen teeth, or to balance teeth that are too small or too large.
