

Cosmetic Gum Surgery Chilliwack

Evaluations of the gumline can be done with digital photos during an appointment to the dentist. By looking at the height of the gum tissues in relation to the other teeth, the oral health doctor can determine how proportioned the periodontal tissues are, so they can try to design your smile with real looking gum lines.

There are two diverse therapies dental clinicians make use of to level out the gums. The first is a periodontal lift and the second is the periodontal graft. The periodontal lift calls for the eliminating gum tissues to flush out both sides of the mouth. The gum graft on the other hand involves the adding of gum tissues to a region which has severe gum recession or a poor root structure. This will help envelop the tooth at the same time as also flattening out the gums around the adjacent teeth.

Based on how much work is needed on the periodontal tissues, a periodontist or gum specialist might be needed to complete the procedure. Typical healing periods take approximately three weeks. Please note - occasionally these operations will be required before any crowns or veneers can be installed.
