

Cosmetic and Restaration Implants

Dental implants can offer support and stability to dental appliances like removable partial or complete dentures and may be a permanent solution for lost or missing teeth.

Dental implants false teeth and roots that are surgically placed into either the lower or upper jaw bone by an oral health care professional. The false teeth attached to dental implants are very organic and natural looking made to restore or enhance a patient's smile! They are very durable, stable, and strong and will last for many years. On occasion, they might have to be replaced or re-tightened due to wear and tear.

Some of the many reasons for dental implants range from restoration to simply provider enhanced aesthetics. They can be use to replace one or more missing teeth or to find a solution for biting issues and joint pain due to teeth that have shifted positions into the missing tooth space. Also, dental implants can heal chewing, speech, or digestion impediments and restore facial tissues in an effort to improve a patients smile. Finally, implants can be used to support a bridge or denture by making them more stable and comfortable.
