

## Composite Fillings Chilliwack

A tooth-coloured composite resin filling could be used in numerous situations to help mend teeth that have cracks, splits, and tooth corrosion. The piece of tooth that has been damaged must be entirely cleaned before the oral health doctor can place a composite resin restoration.

There are several different kinds of tooth restorations offered, with each having their own benefits and drawbacks. You may discuss these with your oral health care professional to determine which may be the best option for restoring your teeth. Silver amalgams and synthetic resin fillings are the most utilized style of tooth restorations being used these days. Composites are very appealing to some people for the reason that these restorations can closely match natural tooth colours. They are more normally utilized on the anterior teeth where they are visible to other people.

Composite resin restorations are not permanent and could need to be changed at some time in the future, they however, are fairly rugged and may last for several years, giving you a long-term beautiful smile.

Individuals may require composite fillings to help mend chipped teeth, decayed teeth, worn teeth, broken or cracked teeth, or to close up a gap between teeth.
